In this project, an integrated inventory model is built for a supply chain with a manufacturer, multiple upstream factories and multiple downstream vendors. Based on some assumptions, all the individual inventory behaviours are considered together to suggest an overall optimised plan to minimise the total inventory cost of the supply chain.

Integrated inventory model Goyal [2] first advocated a notion of an integrated inventory model for a single supplier–single customer problem. He concluded that the optimal order time interval and production cycle time which can be obtained by supposing that the supplier's production cycle time is an integer multiple of the customer's order time interval.

Abstract. Derives an integrated inventory replenishment model for a buyer that buys a single product from a vendor that manufactures this item and delivers it to the former in fixed quantities. It is assumed that both parties co?operate and exchange information, including cost data, which is not unheard of in a JIT based partnering relationship, in deriving a jointly optimal inventory replenishment policy, rather than individually deriving their own independent policies.
