Cardiac operations can be performed safely in patients with end-stage renal disease; the morbidity and mortality are similar to those encountered in patients with normal renal function. The long-term survival after cardiac procedures in patients with end-stage renal disease is similar to that reported for the overall hemodialysis population not having cardiac operations.

There is a paucity of cardiac surgery outcomes data for patients with Noonan syndrome (NS). Our objective was to evaluate early results in these patients. Between January 1999 and December 2015, 29 patients (18 males, 62%) with NS underwent cardiac surgery at our institution. Mean age was 23 ± 17.9 years; 12 (41%) were under 18 years of age.

Overall, 1,743,161 patients underwent cardiac surgery, and 6960 patients had OUD (0.4%). Mean age was 47.2 and 65.8 years among those with and without OUD, respectively. Although in-hospital mortality did not differ among these groups, patients with OUD had a significantly higher incidence of stroke ...

Conclusions Patients with coronary stents undergoing an invasive procedure are at high risk of perioperative myocardial infarction including stent thrombosis irrespective of the stent type and major bleeding. Interruption of OAT more than 5 days prior to an invasive procedure is a key player for MACCE. Clinical Trial Registration NCT01045850.

Deputy Editor: Nancy A Nussmeier, MD, FAHA.

INTRODUCTION. Patients with ischemic heart disease undergoing noncardiac surgery are at increased risk for perioperative cardiovascular events, such as myocardial infarction, heart failure, and mortality. Those with recent myocardial infarction or unstable angina are at very high risk if they require urgent or emergency surgery.

Aims: Severe aortic stenosis (SAS) is a major risk factor for death after non-cardiac surgery, but most supporting data are from studies over a decade old. We evaluated the risk of non-cardiac surgery in patients with SAS in contemporary practice. Methods and results: SAS patients (valve area < 1 cm²), mean gradient > 40 mmHg or peak aortic velocity > 4 m/s) undergoing intermediate or high ...

Perioperative risk of major non-cardiac surgery in ...

Cardiac surgery on hemophilia patients is considered to be an extremely hemostatic challenge. Coagulopathy, particularly caused as a result of total heparinization and extracorporeal circulation, raises the bleeding risk. Our study showed that major cardiac surgery can be accomplished safely in patients with congenital factor deficiency.

This is the largest study of patients with heart failure undergoing major noncardiac surgery in the United States. We found a substantial risk of operative mortality and 30-day all-cause readmission among patients with heart failure compared with patients with CAD and patients with neither heart failure nor CAD.
