Today digital designers use hardware description languages (HDLs) to design digital systems. The most widely used HDLs are VHDL and Verilog. Both of these hardware description languages allow the user to design digital systems by writing a program that describes the behavior of the digital circuit. The program can then be used

The VHDL code for the digital clock is synthesizable for FPGA implementation and full VHDL code is provided. This digital clock is a reconfigurable 24-hour clock displaying hours, minutes, and seconds on seven-segment LEDs (Tutorials on 7-segment LEDs: here). Besides, users can manually set the time of the digital clock including hours and minutes through switches.
